

### **What Is The Shelf Life Of ESD Coated Sheets?**

Our coating is permanent unless mechanically or chemically removed.

The static dissipative surface of our AC300/AC350™ and PC300/PC350™ is permanent, will not change if stored for a period of time. This material should be stored in a temperature-controlled environment and should never be stored in direct sunlight. It should be stored in original packaging in an interior environment at normal room temperatures and humidity. No other materials should be stacked on top of it.

The static dissipative surface is permanent in normal applications, but can be damaged in transportation, installation, or through improper handling, storage, maintenance or exposures to conditions not generally associated with interior applications.

A masking is applied at the factory to protect the sheets prior to use, but that masking can deteriorate with age and become difficult to remove without damaging the coated surface, especially if stored at elevated temperatures or exposed to direct sunlight.

This applies to all SciCron Technologies coated sheets.
